

## **Midterm 1 Practices**

## Differential Equations Summer 2024

## **Instructions:**

The set of questions serves as PILOT practices to midterm 1 for the Summer 2024 term of AS.110.302 Differential Equations and Applications at Johns Hopkins University.

- Questions marked with asterisk(s) are more challenging, but still accessible, compared to the others.
- The questions are designed to be done without notes and calculators.
- Solutions to the questions will be discussed during the PILOT review session.
- 1. Find the general solution for y = y(t):

$$y' + 3y = t + e^{-2t},$$

then, describe the behavior of the solution as  $t \to \infty$ .

2. Given an initial value problem:

$$\begin{cases} \frac{dy}{dt} - \frac{3}{2}y = 3t + 2e^t, \\ y(0) = y_0. \end{cases}$$

- (a) Find the integrating factor  $\mu(t)$ .
- (b) Solve for the particular solution for the initial value problem.
- (c) Discuss the behavior of the solution as  $t \to \infty$  for different cases of  $y_0$ .
- 3. Suppose f(x) is non-zero, let an initial value problem be:

$$\begin{cases} \frac{1-y}{x} \cdot \frac{dy}{dx} = \frac{f(x)}{1+y}, \\ y(0) = 0. \end{cases}$$

(a) Show that the differential equation is **not** linear.

For the next two questions, suppose  $f(x) = \tan x$ .

- (b) State, without justification, the open interval(s) in which f(x) is continuous.
- (c)\* Show that there exists some  $\delta > 0$  such that there exists a unique solution y(x) for  $x \in (-\delta, \delta)$ .

Now, suppose that f(x) is some function, **not** necessarily continuous.

(d)\*\* Suppose that the condition in (c) does **not** hold, give three examples in which f(x) could be.

4. An autonomous differential equation is given as follows:

$$\frac{dy}{dt} = 4y^3 - 12y^2 + 9y - 2$$
 where  $t \ge 0$  and  $y \ge 0$ .

Draw a phase portrait and sketch a few solutions with different initial conditions.

5.\* Determine if the following differential equation is exact. If not, find the integrating factor to make it exact. Then, solve for its general solution:

$$y'(x) = e^{2x} + y(x) - 1.$$

6. Let a differential equation be defined as:

$$\frac{dy}{dt} = t - y \text{ and } y(0) = 0.$$

Use Euler's Method with step size h = 1 to approximate y(5).

7. Solve the following second order differential equations for y = y(x):

(a) 
$$y'' + y' - 132y = 0.$$

(b) 
$$y'' - 4y' = -4y$$
.

(c) 
$$y'' - 2y' + 3y = 0.$$

8.\*\* The following system of partial differential equations portraits the propagation of waves on a segment of the 1-dimensional string of length L, the displacement of string at  $x \in [0, L]$  at time  $t \in [0, \infty)$  is described as the function u = u(x, t):

$$\begin{cases} \text{Differential Equation:} & \frac{\partial^2 u}{\partial t^2} - c^2 \frac{\partial^2 u}{\partial x^2} = 0, & \text{where } x \in (0, L) \text{ and } t \in [0, \infty); \\ \text{Initial Conditions:} & u(x, 0) = \sin \left(\frac{2\pi x}{L}\right), & \\ & \frac{\partial u}{\partial t}(x, 0) = \sin \left(\frac{5\pi x}{L}\right), & \text{where } x \in [0, L]; \\ \text{Boundary Conditions:} & u(0, t) = u(L, t) = 0, & \text{where } t \in [0, \infty); \end{cases}$$

where c is a constant and g(x) has "good" behavior. Apply the method of separation, *i.e.*,  $u(x,t) = v(x) \cdot w(t)$ , and attempt to obtain a general solution that is <u>non-trivial</u>.

*Hint*: Use the fact that  $\{\sin(n\pi x/L), \cos(n\pi x/L)\}_{n\in\mathbb{Z}^+}$  forms an orthonormal basis.

9. Given a differential equation for y = y(t) being:

$$t^3y'' + ty' - y = 0.$$

- (a) Verify that  $y_1(t) = t$  is a solution to the differential equation.
- (b)\* Find the full set of solutions using reduction of order.
- (c) Show that the set of solutions from part (b) is linearly independent.
- 10.\*\* Given the following second order initial value problem:

$$\begin{cases} \frac{d^2y}{dt^2} + \cos(1-x)y = x^2 - 2x + 1, \\ y(1) = 1, \\ \frac{dy}{dt}(1) = 0. \end{cases}$$

Prove that the solution y(x) is symmetric about x = 1, *i.e.*, satisfying that y(x) = y(2 - x). *Hint:* Consider the interval in which the solution is unique.
